

Experiment 2: Average Price of Products

AIM

To calculate the average price of all products sold in the past month using a NumPy array.

ALGORITHM

1. Import NumPy.
2. Create a 3×3 array containing product sales prices.
3. Calculate the average of all elements using `np.mean()`.
4. Display the average price.

CODE

```
import numpy as np

sales_data = np.array([

    [100, 200, 300],

    [150, 250, 350],

    [120, 220, 320]

])

average_price = np.mean(sales_data)

print("Average price of all products:", average_price)
```

INPUT

100 200 300

150 250 350

120 220 320

OUTPUT

```
import numpy as np
sales_data = np.array([
    [100, 200, 300],
    [150, 250, 350],
    [120, 220, 320]
])
average_price = np.mean(sales_data)
print("Average price of all products:", average_price)
```

Python 3.12.4 (tags/v3.12.4:8e8a4ba, Jun 6 2024, 19:13:20) [MSC v.1940 32 bit (Intel)] on win32

>>>
= RESTART: C:/Users/monik/Desktop/SLOT B & C/FODS/expl.py
Average price of all products: 223.33333333333334
>>>

RESULT

Thus, the average price of all products sold in the past month was calculated successfully as 223.33.
